This Lake Ngaroto project will see the installation of a water treatment system to reduce sediment and nutrients entering the lake.

This project involves installing a constructed treatment system on private and public land adjacent to the eastern shore of Ngaroto to reduce sediments and nutrients entering Lake Ngaroto. The constructed treatment system will comprise a series of silt traps and constructed wetlands that will treat 2 drain inflows from a 90 hectare catchment. This project has been identified as a priority in 'Catchment Action Plan for Lake Ngaroto' by Landcare Trust, 2014. The project will provide an additional hectare of wetland habitat on the edge of Lake Ngaroto. WRA 15-012
